# OVERVIEW OF PRESENTATION

- Introduction: Purpose of the research
- Problem Statement :Identifying the gap in traditional career guidance
- Objectives Literature Review Contribution Proposed System
- System Architecture: How the components are connected
- Technologies Used: The core modern tech stack
- Features & Functionality: Detailed system capabilities
- Future Scope: Enhancements and next steps
- Conclusion :Summary of the project's impact

# INTRODUCTION

In today's digital age, students often struggle to access authentic and organized academic materials.

This project aims to develop a centralized platform where students of Computer Science Engineering (CSE) can easily access notes, question papers, and unit-wise study materials.

It bridges the gap between content providers (faculty) and students, ensuring a smooth and verified academic flow.

A digital repository is an online platform for storing, managing, and sharing academic content.

# PROPOSED SOLUTION

- A web-based system for managing and accessing academic content.
- Admin panel for authorized upload of materials.
- Student login for browsing and downloading.
- Clean, responsive, and categorized UI.
- Secure backend with database connectivity

# OBJECTIVES

1. Centralized access to academic content.
2. Subject-wise and unit-wise categorization.
3. Secure login and registration for students/admin.
4. Easy upload and download of files.
5. Reliable, authenticated academic materials.
6. Reduced dependency on external or informal sources.
7. Promote digital and paperless learning.

# LITERATURE REVIEW

| System/<br>Platform       | Description                                                                                                                                        | Limitations/Gaps                                                                                                                                           |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DSpace,Eprints,Greenstone | Widely used open-source platforms for creating digital libraries and institutional repositories.                                                   | Require Complex setup and maintenance: not specifically designed to cater to department-level needs, especially for computer Science and Engineering(CSE). |
| NPTEL & MOOC Platforms    | Provide subject-level academic content through online courses and lectures.                                                                        | Primarily lecture-focused: not designed for internal institutional use such as sharing unit notes,assignments,or previous year question paper.             |
| University Portals        | Many colleges use Content Management System(CMS)or Enterprise Resource Planning (ERP)systems that include document upload and management features. | Often lack user-friendliness and customization for students: not tailored specifically for CSE departmental resources.                                     |

# System Architecture

| Layer    | Techonology         |
|----------|---------------------|
| Frontend | HTML,CSS,JAVASCRIPT |
| Backend  | PHP                 |
| Database | MYSQL               |
| Server   | XAMPP/WAMP          |

# Flowchart

# Future Scope

## **1.Content Expansion:**

- Addition of video lectures, interactive tutorials, and eBooks.
- Integration of lab manuals, Assignments, Previous Year Question Paper,etc.
- Support for multi-disciplinary content beyond just CSE (e.g., ECE, IT).

## **2. User Role Management:**

- Enhanced roles like Admin, Faculty, Student, Guest, and Moderator.
- Role-based access to upload/download/approve materials.
